Brief Description of Project

The Aphrodite App is an interface between the user and the Aphrodite Smart Mirror. The user will be able to create an account in the app that will store the created layouts. Voice commands are also available to the user to control the mirror, as well as an LED colour switcher for the LEDs that are (will be) built into the smart mirror.

Effort Table

Name	ID	Signature	Effort
Daniel Moore	n01354875	<i>DM</i>	100%
Jose Antonio Teodoro	n01384776	<i>JT</i>	100%

Sprint Goals

- Save layouts to database
- Save user information to database
- Refactor classes and remove unwanted code
- Landscape layouts

Sprint Retrospective(Lucidspark)

C4 Model

Design Principles Used

UpdateDBNode.java

```
public class UpdateDBNode {  
  
    /*  
        Principle: Don't Repeat Yourself  
        This class is the interface between the app and the database. Each method corresponds to  
        some functionality that exists in the app that needs to store or retrieve data from the  
        database.  
    */  
}
```

LEDColourFragment.java

```
/*  
    Principle: Keep It Simple and Stupid  
    Each slider updates the colour value in real time and has a separate listener to  
    clearly see where the data is being saved. The button then calls a method that  
    handles the saving of the data in the database.  
*/  
  
red.addOnChangeListener((slider, value, fromUser) -> {  
    int redI = (int) value;  
    redTxt.setText("R: " + redI);  
});  
  
green.addOnChangeListener((slider, value, fromUser) -> {  
    int greenI = (int) value;  
    greenTxt.setText("G: " + greenI);  
});  
  
blue.addOnChangeListener((slider, value, fromUser) -> {  
    int blueI = (int) value;  
    blueTxt.setText("B: " + blueI);  
});
```

Design Patterns Used

MainActivity.java

```
/*
Pattern: Builder
Using the Alert Dialog Builder to for the back button press
*/

private AlertDialog AskExit() {
    return new AlertDialog.Builder( context: this)
        .setTitle("Exit App")
        .setIcon(R.drawable.cancel_button)
        .setMessage("Are you sure you want to exit?")
        .setPositiveButton("Yes, exit app", (dialog, which) -> {
            FirebaseAuth.getInstance().signOut();
            finish();
        })
        .setNegativeButton("No, stay in app", (dialog, which) -> dialog.dismiss())
        .create();
}
```

CreateLayoutFragment.java

```
/*
Pattern: Adapter
Using this array adapter to store strings to be used in the dropdown without changing the code
*/

ArrayAdapter<CharSequence> adapter = ArrayAdapter.createFromResource(getActivity().getBaseContext(), R.array.Layout_Values, android.R.layout.simple_spinner_item);
adapter.setDropDownViewResource(android.R.layout.simple_spinner_dropdown_item);
```

Coding Progress since Deliverable 2

Home Page

- Created a page called "Create Layout" page/fragment
- Connected Home page to "Create Layout" Page using the "Add" button in Home.
- Switches toggle whether the module is active and the spinner selects the location for that module
- Save button in Create Layout page saves the layout to the user's id under the layouts node in the database

Layouts Page

- Created RecyclerView and CardView for the created layouts page
- Title and description boxes with hints for the user to create a layout from created layouts page
- Create layout button

Account Page

- Made the buttons on the page functional (About Us, Review and Settings)
- The About Us page consists of a short text about the project and text that displays the company email.
- The Review Page lets users give star reviews and also text reviews. The data will then be sent to the database once the Submit button is pressed. Made the page functional.
- The Settings Page contains a terminate account button and a logout button. This page will let users log out of the app and also have the choice to permanently terminate their Aphrodite account. After pressing on the terminate button, the user will then be brought to the login page. Made the page functional.

Voice Commands

- Will show the voice commands that are available on the mirror and an option to record a sound for them
- LED Colour button functional, it brings the user to the Customize LED Page.

LED Page

- Added LED Page to customize LED Colour
- Submit button will save the colour to the database under the current users id
